

Eaton ET9200-10-220 Hydraulic Hose Saw

Powering Business Worldwide

Introduction

Eaton hydraulic hose cutting system is break-through technology using a toothed knife, cutting with the backs of each tooth, so the knife does not take a kerf. The saw bends the hose into the blade spreading the cut edges to avoid burning and smoking.

How It Works

Old Method

The normal sawing method of lowering an abrasive saw blade onto the hose causes the hose to compress and deform. As the blade cuts the compressed hose expands against the blade causing friction, heating and burning and much of the debris from the kerf of the blade is deposited into your hose.

New Improved Eaton Method

With the Eaton hydraulic hose saws the hose is positioned across two pins (A) and moved into the blade (C) by a feed foot (B) using extendable handle (D) for better leverage on extremely heavy hose. The feed motion causes the hose to stretch at the point of contact with the blade, allowing it to separate as it is cut (see image at below). This separation allows the hose to pass clear of the saw blade with NO friction, NO heating and NO DEBRIS! A vacuum hose (not shown) is attached to a vacuum port to remove any tiny amount of debris or smoke during cutting.
